

**THE 17TH INTERNATIONAL WORKSHOP ON NONDESTRUCTIVE QUALITY
EVALUATION OF AGRICULTURAL, LIVESTOCK AND FISHERY PRODUCTS**

Crop Monitoring Using AI Technology on UAV Images

Ming-Der Yang,

Director, Intelligent Agriculture Research Center

Dean, College of Engineering

National Chung Hsing University

October 29, 2024

Phenotyping

- Plant traits, canopy, leaves, roots, growth rate, disease detection, and nutrient, analyzed by integrating **imaging technology** and **plant science**.
- **Image processing** enhances the efficiency, accuracy, and scope of phenotyping, transforming the way researchers study plant traits for innovations in agriculture, such as breeding stress-resilient crops and optimizing resource use.

 Leaf color, Leaf temp, height, Chlorophyll index, Leaf moisture

Ripening
 RGB+NIR+HIS / 3cm↑
 Status of rice ear, yield estimation, health status

1. Plant Growth Monitoring

- Time-lapse imaging tracks changes in plant height, leaf area, and biomass.

Application:
plant height
Height: 20m / 10m
Resolution: 5472 x 3648
Band: R, G, B
Overlap: 85%

Application:
leaf color, green coverage ratio
Height: 40m
Resolution: 1280 x 960
Band: R, G, B, Rededge, NIR
Overlap: 75%

2. Disease Detection and Plant Health Monitoring

- Image analysis detects early signs of diseases and pest attacks.
- Hyperspectral and thermal imaging detect changes invisible to the naked eye.
- Allows early intervention, reducing potential crop losses.

- Application scenarios

Disease Detection and treatment

With a combination of edge computing technique, precision agriculture practices, such as site-specific fertilizing or pesticide application can be performed.

Rice blast disease infection area in red.

Edge computing adjusts pesticide spraying concentration

3. Drought Stress and Water/fertilizer-Use Efficiency

- Thermal and infrared imaging measure leaf and canopy temperature.
- Evaluate plant responses to drought and water management.

4. Photosynthesis and Chlorophyll Content Estimation

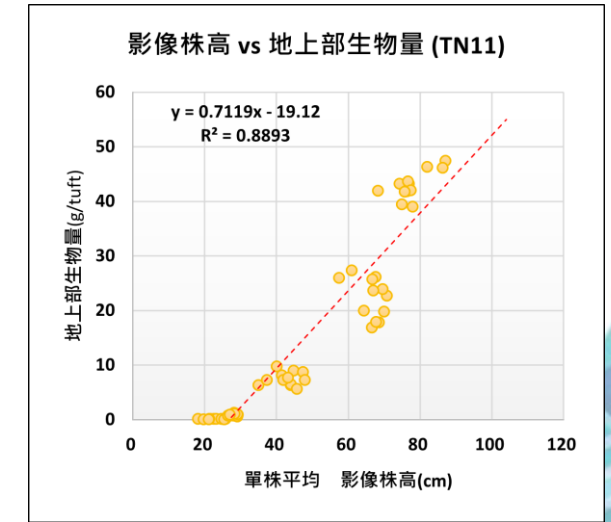

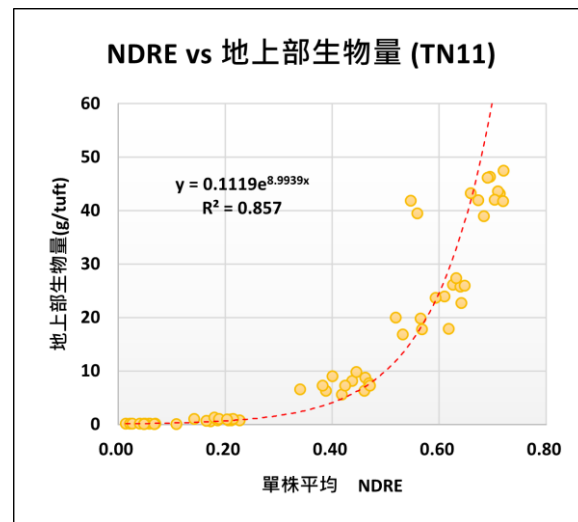

- Fluorescence and hyperspectral imaging measure photosynthesis efficiency.
- Assesses chlorophyll content to evaluate plant health.
- High-performing plants breeding.

5. Yield Prediction

- **Image analysis assessing flowering time, fruit set, grain filling, and harvest timing.**
- Predicts crop yields and genotype selection for higher yield potential.

Maturity assessment & optimal harvest timing

Grain Moisture Content (GMC) is the key factor for rice harvesting. Sarkar *et al.* (2018)
 High Harvesting GMC causes a high cost and low quality. Lu *et al.*(1995)
 GMC needs to be reduced to 15% from 32% for storage.

成熟程度

- 青米比率高，烘乾時間增加150%以上
- 米質變動大
- 精米過程嚴重耗損
- 收購價格低落

Lu et al.(1995) [3]
 Hong, and Song (1988)[7]
 Toshizo(2013)[10]
 Otto(2018)[11]

Experience
 -dependent

- 洞裂率高
- 米質變動大
- 產量耗損高
- 倒伏災損機率高

Sarkar *et al.* (2018)[6]

AI image analysis on rice cultivation

A photograph of a rice paddy field at sunset. The sun is low on the horizon, casting a golden glow over the scene. The water in the paddy field reflects the sun and the sky. In the background, there are several high-voltage power lines and towers stretching across the landscape. The overall atmosphere is peaceful and serene.
